ASSIGNMENT NO: BD5

TITLE:

Write a program in Python/ Java/ C++/Scala using Eclipse to Start/Stop the IDS, View current traffic, view blocked list (IP, Domains), view current firewall rules and unblock users. Create Necessary GUI.

PREREQUISITES

- 64-bit Fedora or equivalent OS with 64-bit Intel-i5/i7
- Java 1.7.0

OBJECTIVES:

- 1. To develop problem solving abilities using Mathematical Modeling.
- 2. To understand the use and working of Intrusion Detection System.

MATHEMATICAL MODEL:

Let P be the solution perspective.

```
P = \{ S, E, I, O, F \}
S = { Initial state of the IDS, Initialize IP Tables with forward chain replica }
I = Input of the system \rightarrow \{ I1, I2 \}
where,
I1 = { IpTable_INPUT }
I2 = { IpTable_FORWARD }
O = Output of the system \rightarrow \{ O1, O2, O3, O4 \}
where.
O1 = { list_blocked_ip }
O2 = { display_firewall_rules}
O3 = {Allow_unblock_ip}
O4 = \{Allow\_IDS\_ON/OFF\}
F = Functions used \rightarrow \{ f1, f2, f3 \}
where
f1 = \{ IDS \text{ on } / \text{ off } \}
f2 = { Blocked_ip_iptables }
f3 = { Unblock_ip_iptables }
f4 = {Display_rules}
E = End state of the system shows successfully handling and updating the IDS and firewall
rules of the system.
```

THEORY:

An intrusion detection system (IDS) inspects all inbound and outbound network activity and identifies suspicious patterns that may indicate a network or system attack from someone attempting to break into or compromise a system.

There are several ways to categorize IDS:

- Misuse detection vs. anomaly detection: in misuse detection, the IDS analyzes the information it gathers and compares it to large databases of attack signatures. Essentially, the IDS looks for a specific attack that has already been documented. Like a virus detection system, misuse detection software is only as good as the database of attack signatures that it uses to compare packets against. In anomaly detection, the system administrator defines the baseline, or normal, state of the networks traffic load, breakdown, protocol, and typical packet size. The anomaly detector monitors network segments to compare their state to the normal baseline and look for anomalies.
- **Network-based** vs. **host-based systems**: in a network-based system, or NIDS, the individual packets flowing through a network are analyzed. The NIDS can detect malicious packets that are designed to be overlooked by a firewall simplistic filtering rules. In a host-based system, the IDS examines at the activity on each individual computer or host.
- **passive system** vs. **reactive system**: in a passive system, the IDS detects a potential security breach, logs the information and signals an alert. In a reactive system, the IDS responds to the suspicious activity by logging off a user or by reprogramming the firewall to block network traffic from the suspected malicious source.

Difference between IPS and IDS:

Sr	Parameters	Intrusion Prevention	Intrusion Detection	
no.		System	System	
1.	Placement in network	Part of the direct line of	of the direct line of Outside direct line of	
	infrastructure	communication(inline)	communication(Out	
			of band)	
2.	System Type	Active and/or passive	Passive	
3.	Detection Mechanisms	1.Stastical anomaly	Signature detection	
		based detection		
		2. Signature detection		
4.	Usefulness	Ideal for blocking web	Ideal for identifying	
		destruction	blocking attacks	
5.	Traffic Requirement	"Original" traffic is	Traffic replication is	
		required	required	

Types of IDS:

1. Active and passive IDS:

An active Intrusion Detection Systems (IDS) is also known as Intrusion Detection and Prevention System (IDPS). Intrusion Detection and Prevention System (IDPS) is configured to automatically block suspected attacks without any intervention required by an operator.

A **passive IDS** is a system that's configured to only monitor and analyze network traffic activity and alert an operator to potential vulnerabilities and attacks. A passive IDS is not capable of performing any protective or corrective functions on its own.

2. Network Intrusion detection systems (NIDS) and Host Intrusion detection systems (HIDS)

Network Intrusion Detection Systems (NIDS) usually consists of a network appliance (or sensor) with a Network Interface Card (NIC) operating in promiscuous mode and a separate management interface. The IDS is placed along a network segment or boundary and monitors all traffic on that segment.

A **Host Intrusion Detection Systems (HIDS)** and software applications (agents) installed on workstations which are to be monitored. The agents monitor the operating system and write data to log files and/or trigger alarms.

3. Knowledge-based (Signature-based) IDS and behavior-based (Anomaly-based) IDS

A knowledge-based (Signature-based) Intrusion Detection Systems (IDS) references a database of previous attack signatures and known system vulnerabilities. The meaning of word signature, when we talk about Intrusion Detection Systems (IDS) is recorded evidence of an intrusion or attack. Each intrusion leaves a footprint behind (e.g., nature of data packets, failed attempt to run an application, failed logins, file and folder access etc.). These footprints are called signatures.

A Behavior-based (Anomaly-based) Intrusion Detection Systems (IDS) references a baseline or learned pattern of normal system activity to identify active intrusion attempts. Deviations from this baseline or pattern cause an alarm to be triggered.

Advantages of IDS:

- 1. It can detect the unauthorized user
- 2. It can detect password cracking and denial of services
- 3. It can catch illegal data manipulations
- 4. Monitors the operations of firewalls
- 5. Allows administrator to tune, organize operating system audit trails other logs.

Disadvantages of IDS:

- 1. Host-based IDS works well for a single machine, extremely labor-intensive of monitor multiple machines.
- 2. If host is compromised, then no more alerts will be generated
- 3. There is no detection with unknown signatures

Example:

Examples of Network IDS:

SNORT

Examples of HIDS:

- OSSEC Open Source Host-based Intrusion Detection System
- Tripwire
- AIDE Advanced Intrusion Detection Environment
- Prelude Hybrid IDS

IMPLEMENTATION DETAILS / DESIGN LOGIC:

(Algorithm/Flow Charts/Pseudo Code/DFD/UML diagrams)

Algorithm:-

- 1. Initialize the IP Tables with forward chain and Input chain.
- 2. Install open source IDS on the system(In this case PSAD IDS) as follows: sudo apt get install psad
- 3. Create a logging of the INPUT and FORWARD chain as follows:

sudo iptables –A INPUT –j LOG sudo iptables –A FORWARD –j LOG

4. Flush the rules if any made earlier as follows:

sudo iptables –F

5. Display the rules:

sudo iptables -L

 Explicitly allow all traffic related to an existing connection: sudo iptables –A INPUT –m conntrack –ctstate ESTABLISHED,RELATED –j ACCEPT

7. Make these rules persistent so that it can't be default after restart:

sudo apt-get install iptables-persistent sudo service iptables-persistent start

8. Open and change the config file if required:

sudo gedit /etc/psad/psad.conf search for e-mail and domain

9. Restart the service of PSAD: sudo service psad restart

Input :-

Iptable INPUT and FORWARD chain

Expected Output:-

- 1. Allow IDS on/off
- 2. Display Blocked IP list
- 3. Display Firewall rules
- 4. Unblock IPs

Execute the program with the following commands.

Note: Make sure you should be sudo user.

>sudo su

>javac IDS1.java

>java IDS

TEST CASES:

Test ID	Description	Input	Expected	Actual output
			output	
1.	List all blocked	INPUT CHAIN	Should list all	Listing all
	IPs		blocked IPs	blocked IPs
2.	Start IDS	IDS install	Should start the	IDS got started
			IDS	
3.	Start IDS	IDS not install	Should provide	IDS not started
			the exception	
			and not able to	
			start IDS	
4.	List Firewall	FORWARD	Should display	Displaying
	rules	chain	Firewall rules	firewall rules
5.	Unblocking the	IP address	Should unblock	Unblocked and
	IPs		IP(s) from the	removed from
			IP Table	IP tables

CONCLUSION:

Hence based on the rule of firewall and IDS, we have learnt about the blocking and unblocking the IPs from the IP tables and configuring the IDS.
